Tables 1

In 50 patients, a study was made of the postoperatively inhibited urine excretion, the reduced minute volume, increased specific gravity, reduced excretion of sodium and chlorine, and the increased excretion of potassium. This reaction complex, tested on the basis of the results of rapid i.v. infusion of 600 ml. of a 5% glucose solution, is not significantly influenced by the administration of ganglion-blocking agents. Neither chlorpromazine nor dehydrogenated derivatives of ergotoxin have an influence on the postoperative suppression of urinary excretion. Under physiological conditions, normal subjects excrete the administered fluid within 3 or 4 hr.; the minute volume increases, while the specific gravity decreases. Administration of an extract of the posterior lobe of the pituitary gland causes water to be retained, the minute volume to fall, and the specific gravity to remain high. After operation under potentiated anaesthesia in hypothermia, the postoperative limitation of kidney function remains the same. Nor is any postoperative effect seen when

Abstract: [Authors' Hungarian summary, modified] Physiological saline suspension or extract prepared from rat-, bovine- and rabbit posterior hypothalamus was administered over a prolonged period of time to female rats. It was found that the weight of the animals' thyroid glands increased as a result of the treatment to a moderate but nevertheless statistically significant degree. No such effect was noted with suspensions prepared from the middle- or anterior portion of the hypothalamus or from the cerebral cortex. In rats pretreated with thyro-

TITLE: Method of testing the tube ELW1

PERIODICAL: Przeglad elektroniki, no. 2, 1963, 120 - 124

TEXT: The tube is a decade counter device and a direct equivalent of the Philips tube, type E1T. Static live-testing of the tube is performed by applying a DC component plus a suitable AC component taken from the mains to the deflection system. These voltages are chosen in such a way that all the positions of the tube corresponding to digits 0 to 9 are illuminated. This approach results in a continuous uniform loading of the cathode and permits live-testing of the luminescent screen. The dynamic testing was carried out by driving the tube at 3 and 50 000 p.p.s. The correctness of operation was checked by observing stepwise waveforms or suitable Lissajou curves. During the life tests, the parameters such as the interelectrode leakage, cathode-heater current; heating time of the cathode, heater current, readability of the digits and the capacitances of the tube were also checked.

TITLE: Effect of hypoxia on electric activity of cerebral cortex and  
on excitability of carotid sinus chemoreceptors under different  
oxygen diffusion conditions

SOURCE: Fiziologicheskiy zhurnal SSSR, v. 50, no. 3, 1964, 259-267

TOPIC TAGS: hypoxia effect, cerebral cortex electric activity,  
carotid sinus chemoreceptor, chemoreceptor excitability, oxygen  
diffusion, polycythemia, hemopoiesis, oxygen pressure change

ABSTRACT: Changes in oxygen diffusion of blood supplied to higher  
nerve centers were investigated in the first of two experimental  
series. Persons with vera polycythemia were used as subjects  
because the hyperplasia of blood-forming cells in the bone marrow  
obstructs oxygen diffusion and stimulates hemopoiesis. Healthy  
persons served as a control. See enclosure 1 for experimental setup.  
In the second series the effect of carotid sinus chemoreceptors on

Card 1/6

ACCESSION NR: AP4020915

hemopoiesis and on adaptive reaction to hypoxia was investigated in three pairs of dogs. See enclosure 2. Perfusion of the isolated innervated carotid sinus was performed according to Heyman's method (1939). The donor was kept in a hypoxic state until breathing stopped and then the isolated carotid sinus of the donor was perfused with a thrombin solution for 2 min to increase intravascular fibrin layer. Repeated hypoxia was induced in the donor 10 min later. Findings indicate that in vera polycythemia, oxygen diffusion disorders in the nerve centers are expressed in EEG by appearance of fast beta-waves with occasional superimposition of slow waves. In subjects with true polycythemia, EEG changes induced by hypoxia appear sooner. At the same time, oxygen saturation of arterial blood is lower in such subjects than in healthy subjects. One of the pathogenetic mechanisms of vera polycythemia is the oxygen diffusion disorder between the blood and the mesencephalon centers which take part in regulating blood formation. Reduced oxygen diffusion between the blood and the carotid sinus chemoreceptors, induced by increasing the intravascular fibrin layer in the carotid sinus zone, leads to weakening of the reflex respiratory reaction during hypoxia of this zone. Restricted oxygen diffusion to nerve centers which regulate blood formation

stimulates these centers, causing a temporary reaction of the erythrocyte cells or a prolonged reaction characteristic of polyglobulia. However, restricted oxygen diffusion between blood and carotid sinus chemoreceptors markedly reduces their sensitivity to partial oxygen pressure changes of the blood. Orig. art. has: 5 figures.

radiometer modulator. Modulation curves at the operating frequency are presented for the case when the same amount of power is fed to the inputs of both channels. The rise and fall times of the pulses are equal to each other and amount to ~4% of the pulse duration. The power pulsations amount to <1% within 85% of the pulse duration. The decoupling between the channels is not less than 28 dB. The losses in the modulator are equal to  $1.2 \pm 0.1$  dB, and can be reduced by using dielectrics with lower losses. The principle described can be used to construct modulators for other wavelengths in the decimeter band, too. Yu. Khotuntsev.

On Groups With Increasing Central Series (O gruppakh s voz-rastayushchim tsentral'nym ryadom)

PERIODICAL:

Matematicheskiy Sbornik, 1958, Vol 45, Nr 1, pp 105-112 (USSR)

ABSTRACT:

Mukhammedzhan [Ref 3] showed: If at least one of the maximum abelian normal subgroups of a periodic ZA-group  $G$  satisfies the minimum condition for the normal subgroups of  $G$ , then  $G$  is special in the sense of Chernikov [Ref 2]. The author shows by an example that the theorem holds no longer for periodic properly nilpotent groups. A further example shows that a nilpotent group which satisfies the minimum condition for the abelian normal subgroups need not necessarily be special. Furthermore two theorems are proved:

Theorem: If  $G$  possesses an increasing central series and if at least one of its maximum abelian normal subgroups has a finite number of generating elements, then  $G$  is nilpotent and has finitely many generating elements.

Theorem: If  $G$  possesses an increasing central series, then the intersection of its normal subgroup different from the unit and completely torsionless, with the center of  $G$  is a

SOV/71-59-2-14/26

TITLE:

Efficiency Increase of the Bottling Line (Povysheniye roizvoditel'nosti linii rozliva)

PERIODICAL:

Spirtovaya promyshlennost' 1959, Nr 2, pp 36-40 (USSR)

ABSTRACT:

In the bottle-washing and bottling department of the Moscow Liqueur-Vodka Plant (Moskovskiy likero-vodochnyy zavod) the bottling line comprises the following units: bottle-washing machine with unloading platform, small conveyor, rejection post for defective bottles, bottle distributor for 2 conveyors, bottling unit, closing machine, automatic rejector, labelling unit, 2 bottling-line conveyors and escalator. With 2 shifts per day the plant turns out 32,000 dkl of bottled vodka daily. The plant has introduced a number of measures tending to increase efficiency of the bottling lines. For bottle-washing special cages have been designed with 15 and 18 sockets to take 0.25 liter bottles and 0.5 liter bottles (instead of 12 and 15 sockets). The increased flow of washed bottles involved faster bottling. For this purpose the diameter of the nipples of the automatic filling machine of the Zhukov system had to be increased by 10 mm. Other units which showed frequent brake-downs on account of the faster production rate, needed special

Card 1/3

Efficiency Increase of the Bottling Line

SOV/71-59-2-14/26

adjustment. Particular trouble gave the labelling machine. The bottling-line conveyor belt, it was found, had to run with a speed corresponding with that of the automatic machine e. g. by feeding as many bottles per minute as the machine can process, plus 1 bottle; for instance, if the machine fills 70 bottles, the line conveyor had to be set to feed 71 bottles and the small conveyor  $71 + 71 + 2 = 144$  bottles, which works out at 10.944 m per minute, in other words the output of the bottling-line conveyor must exceed the output of the machine by 1.5%, and the output of the small conveyor by 3% accordingly. Each automatic machine should operate under a waiting reserve of 4 - 5 bottle pressure. Average spoilage amounts to 3 - 4 %. As a rule all machines should work with the same speed in order to avoid congestion; therefore it is most important to watch the speed of the conveyor belt. At the present time bottling conveyor lines are kept as short as possible (11 m instead of 14 m). A system has been worked out whereby from certain important points it is possible to block the whole line by pushing button

Card 2/3

Efficiency Increase of the Bottling Line

SOV/71-59-2-14/26

"stop" and to start it again by pressing button "go". A table shows the increase in production obtained by the various measures adopted for that purpose. There are 2 graphs, 3 photos, 1 diagram and 1 table.
